April → August summary

Automated segmented lesion volume changed from 97.64 mL to 46.56 mL (-52.3%). Burden changed from 6.49% to 3.17%. Internal-reference comparability is high. These outputs require radiologist confirmation and are not a diagnosis or treatment-planning measurement.

Tracking safeguards

Tracks are assigned using registered spatial overlap/centroid, Couinaud segment, morphology and vessel topology. One-to-one assignment is preferred; ambiguous matches and split/merge events are explicitly flagged. L04 is a split/merge case in April. A missing separate component does not prove lesion resolution.
